1.1 Modules

- **dialog** (*Section 2, p. 3*)
 - **lottosystem**: pyLottoSimu
(*Section 3, p. 4*)
 - **show_drawing**: pyLottoSimu
(*Section 4, p. 18*)
- **lottokugeln_rc** (*Section 5, p. 23*)
- **lottokugeln_rc3** (*Section 6, p. 24*)
- **lottokugeln_rc3_qt5** (*Section 7, p. 25*)
- **pylotto**: The signals for the GUI
(*Section 8, p. 26*)

1.2 Functions

gui(*arguments*)

Open the GUI

Parameters

arguments: language, see in folder translate
(*type=string*)

Return Value

none

1.3 Variables

Name	Description
<code>__package__</code>	Value: 'pylottosimu'

2 Package pylottosimu.dialog

2.1 Modules

- **lottosystem:** pyLottoSimu
(Section 3, p. 4)
- **show_drawing:** pyLottoSimu
(Section 4, p. 18)

2.2 Variables

Name	Description
__package__	Value: None

3 Module pylottosimu.dialog.lottosystem

pyLottoSimu

Copyright (C) <2012-2015> Markus Hackspacher

This file is part of pyLottoSimu.

pyLottoSimu is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version.

You should have received a copy of the GNU General Public License along with pyLottoSimu. If not, see <<http://www.gnu.org/licenses/>>.

3.1 Functions

gui (arguments, sysdat)
Open the GUI of the LottoSettings Dialog
Parameters
arguments: language, see in folder translate (type=string)
Return Value
none

3.2 Variables

Name	Description
__package__	Value: 'pylottosimu.dialog'

3.3 Class str

str(object) -> string

Return a nice string representation of the object. If the argument is a string, the return value is the same object.

3.3.1 Methods

<code>__add__</code> (<i>x</i> , <i>y</i>)
<code>x+y</code>

<code>__contains__</code> (<i>x</i> , <i>y</i>)
<code>y in x</code>

<code>__eq__</code> (<i>x</i> , <i>y</i>)
<code>x==y</code>

<code>__format__</code> (<i>S</i> , <i>format_spec</i>)
Return a formatted version of S as described by format_spec.
Return Value
string
Overrides: object.__format__

<code>__ge__</code> (<i>x</i> , <i>y</i>)
<code>x>=y</code>

<code>__getattr__</code> (...)
<code>x.__getattr__('name') <==> x.name</code>
Overrides: object.__getattr__

<code>__getitem__</code> (<i>x</i> , <i>y</i>)
<code>x[y]</code>

<code>__getnewargs__</code> (...)

<code>__getslice__</code> (<i>x</i> , <i>i</i> , <i>j</i>)
<code>x[i:j]</code>
Use of negative indices is not supported.

<code>__gt__</code> (<i>x</i> , <i>y</i>)
<code>x>y</code>

<code>__hash__</code> (<i>x</i>)
<code>hash(x)</code>
Overrides: object.__hash__

<code>__le__(x, y)</code>
<code>x<=y</code>

<code>__len__(x)</code>
<code>len(x)</code>

<code>__lt__(x, y)</code>
<code>x<y</code>

<code>__mod__(x, y)</code>
<code>x%y</code>

<code>__mul__(x, n)</code>
<code>x*n</code>

<code>__ne__(x, y)</code>
<code>x!=y</code>

<code>__new__(T, S, ...)</code>
Return Value a new object with type S, a subtype of T Overrides: object.__new__

<code>__repr__(x)</code>
<code>repr(x)</code> Overrides: object.__repr__

<code>__rmod__(x, y)</code>
<code>y%x</code>

<code>__rmul__(x, n)</code>
<code>n*x</code>

<code>__sizeof__(S)</code>
size of object in memory, in bytes
Return Value size of S in memory, in bytes Overrides: object.__sizeof__

__str__ (<i>x</i>)
<code>str(x)</code>
Overrides: <code>object.__str__</code>

capitalize (<i>S</i>)
Return a copy of the string <i>S</i> with only its first character capitalized.
Return Value string

center (<i>S, width, fillchar=...</i>)
Return <i>S</i> centered in a string of length <i>width</i> . Padding is done using the specified fill character (default is a space)
Return Value string

count (<i>S, sub, start=..., end=...</i>)
Return the number of non-overlapping occurrences of substring <i>sub</i> in string <i>S</i> [<i>start</i> : <i>end</i>]. Optional arguments <i>start</i> and <i>end</i> are interpreted as in slice notation.
Return Value int

decode (<i>S, encoding=..., errors=...</i>)
Decodes <i>S</i> using the codec registered for encoding. <i>encoding</i> defaults to the default encoding. <i>errors</i> may be given to set a different error handling scheme. Default is 'strict' meaning that encoding errors raise a <code>UnicodeDecodeError</code> . Other possible values are 'ignore' and 'replace' as well as any other name registered with <code>codecs.register_error</code> that is able to handle <code>UnicodeDecodeErrors</code> .
Return Value object

encode (<i>S, encoding=..., errors=...</i>)
Encodes <i>S</i> using the codec registered for encoding. <i>encoding</i> defaults to the default encoding. <i>errors</i> may be given to set a different error handling scheme. Default is 'strict' meaning that encoding errors raise a <code>UnicodeEncodeError</code> . Other possible values are 'ignore', 'replace' and 'xmlcharrefreplace' as well as any other name registered with <code>codecs.register_error</code> that is able to handle <code>UnicodeEncodeErrors</code> .
Return Value object

endswith(*S, suffix, start=..., end=...*)

Return True if S ends with the specified suffix, False otherwise. With optional start, test S beginning at that position. With optional end, stop comparing S at that position. suffix can also be a tuple of strings to try.

Return Value

bool

expandtabs(*S, tabsize=...*)

Return a copy of S where all tab characters are expanded using spaces. If tabsize is not given, a tab size of 8 characters is assumed.

Return Value

string

find(*S, sub, start=..., end=...*)

Return the lowest index in S where substring sub is found, such that sub is contained within S[start:end]. Optional arguments start and end are interpreted as in slice notation.

Return -1 on failure.

Return Value

int

format(*S, *args, **kwargs*)

Return a formatted version of S, using substitutions from args and kwargs. The substitutions are identified by braces ('{' and '}').

Return Value

string

index(*S, sub, start=..., end=...*)

Like S.find() but raise ValueError when the substring is not found.

Return Value

int

isalnum(*S*)

Return True if all characters in S are alphanumeric and there is at least one character in S, False otherwise.

Return Value

bool

isalpha(*S*)

Return True if all characters in S are alphabetic and there is at least one character in S, False otherwise.

Return Value

bool

isdigit(*S*)

Return True if all characters in *S* are digits and there is at least one character in *S*, False otherwise.

Return Value

bool

islower(*S*)

Return True if all cased characters in *S* are lowercase and there is at least one cased character in *S*, False otherwise.

Return Value

bool

isspace(*S*)

Return True if all characters in *S* are whitespace and there is at least one character in *S*, False otherwise.

Return Value

bool

istitle(*S*)

Return True if *S* is a titlecased string and there is at least one character in *S*, i.e. uppercase characters may only follow uncased characters and lowercase characters only cased ones. Return False otherwise.

Return Value

bool

isupper(*S*)

Return True if all cased characters in *S* are uppercase and there is at least one cased character in *S*, False otherwise.

Return Value

bool

join(*S*, *iterable*)

Return a string which is the concatenation of the strings in the iterable. The separator between elements is *S*.

Return Value

string

ljust(*S*, *width*, *fillchar*=...)

Return *S* left-justified in a string of length *width*. Padding is done using the specified fill character (default is a space).

Return Value

string

lower(*S*)

Return a copy of the string *S* converted to lowercase.

Return Value

string

lstrip(*S*, *chars*=...)

Return a copy of the string *S* with leading whitespace removed. If *chars* is given and not *None*, remove characters in *chars* instead. If *chars* is unicode, *S* will be converted to unicode before stripping

Return Value

string or unicode

partition(*S*, *sep*)

Search for the separator *sep* in *S*, and return the part before it, the separator itself, and the part after it. If the separator is not found, return *S* and two empty strings.

Return Value

(head, sep, tail)

replace(*S*, *old*, *new*, *count*=...)

Return a copy of string *S* with all occurrences of substring *old* replaced by *new*. If the optional argument *count* is given, only the first *count* occurrences are replaced.

Return Value

string

rfind(*S*, *sub*, *start*=... , *end*=...)

Return the highest index in *S* where substring *sub* is found, such that *sub* is contained within *S*[*start*:*end*]. Optional arguments *start* and *end* are interpreted as in slice notation.

Return -1 on failure.

Return Value

int

rindex(*S*, *sub*, *start*=... , *end*=...)

Like *S*.*rfind*() but raise *ValueError* when the substring is not found.

Return Value

int

rjust(*S*, *width*, *fillchar*=...)

Return *S* right-justified in a string of length *width*. Padding is done using the specified fill character (default is a space)

Return Value

string

rpartition(*S*, *sep*)

Search for the separator *sep* in *S*, starting at the end of *S*, and return the part before it, the separator itself, and the part after it. If the separator is not found, return two empty strings and *S*.

Return Value

(head, sep, tail)

rsplit(*S*, *sep*=... , *maxsplit*=...)

Return a list of the words in the string *S*, using *sep* as the delimiter string, starting at the end of the string and working to the front. If *maxsplit* is given, at most *maxsplit* splits are done. If *sep* is not specified or is *None*, any whitespace string is a separator.

Return Value

list of strings

rstrip(*S*, *chars*=...)

Return a copy of the string *S* with trailing whitespace removed. If *chars* is given and not *None*, remove characters in *chars* instead. If *chars* is unicode, *S* will be converted to unicode before stripping

Return Value

string or unicode

split(*S*, *sep*=... , *maxsplit*=...)

Return a list of the words in the string *S*, using *sep* as the delimiter string. If *maxsplit* is given, at most *maxsplit* splits are done. If *sep* is not specified or is *None*, any whitespace string is a separator and empty strings are removed from the result.

Return Value

list of strings

splitlines(*S*, *keepends*=**False**)

Return a list of the lines in *S*, breaking at line boundaries. Line breaks are not included in the resulting list unless *keepends* is given and true.

Return Value

list of strings

startswith(*S*, *prefix*, *start*=... , *end*=...)

Return True if *S* starts with the specified prefix, False otherwise. With optional *start*, test *S* beginning at that position. With optional *end*, stop comparing *S* at that position. *prefix* can also be a tuple of strings to try.

Return Value

bool

strip(*S*, *chars*=...)

Return a copy of the string *S* with leading and trailing whitespace removed. If *chars* is given and not None, remove characters in *chars* instead. If *chars* is unicode, *S* will be converted to unicode before stripping

Return Value

string or unicode

swapcase(*S*)

Return a copy of the string *S* with uppercase characters converted to lowercase and vice versa.

Return Value

string

title(*S*)

Return a titlecased version of *S*, i.e. words start with uppercase characters, all remaining cased characters have lowercase.

Return Value

string

translate(*S*, *table*, *deletechars*=...)

Return a copy of the string *S*, where all characters occurring in the optional argument *deletechars* are removed, and the remaining characters have been mapped through the given translation table, which must be a string of length 256 or None. If the *table* argument is None, no translation is applied and the operation simply removes the characters in *deletechars*.

Return Value

string

upper(*S*)

Return a copy of the string *S* converted to uppercase.

Return Value

string

zfill(*S*, *width*)

Pad a numeric string *S* with zeros on the left, to fill a field of the specified width. The string *S* is never truncated.

Return Value

string

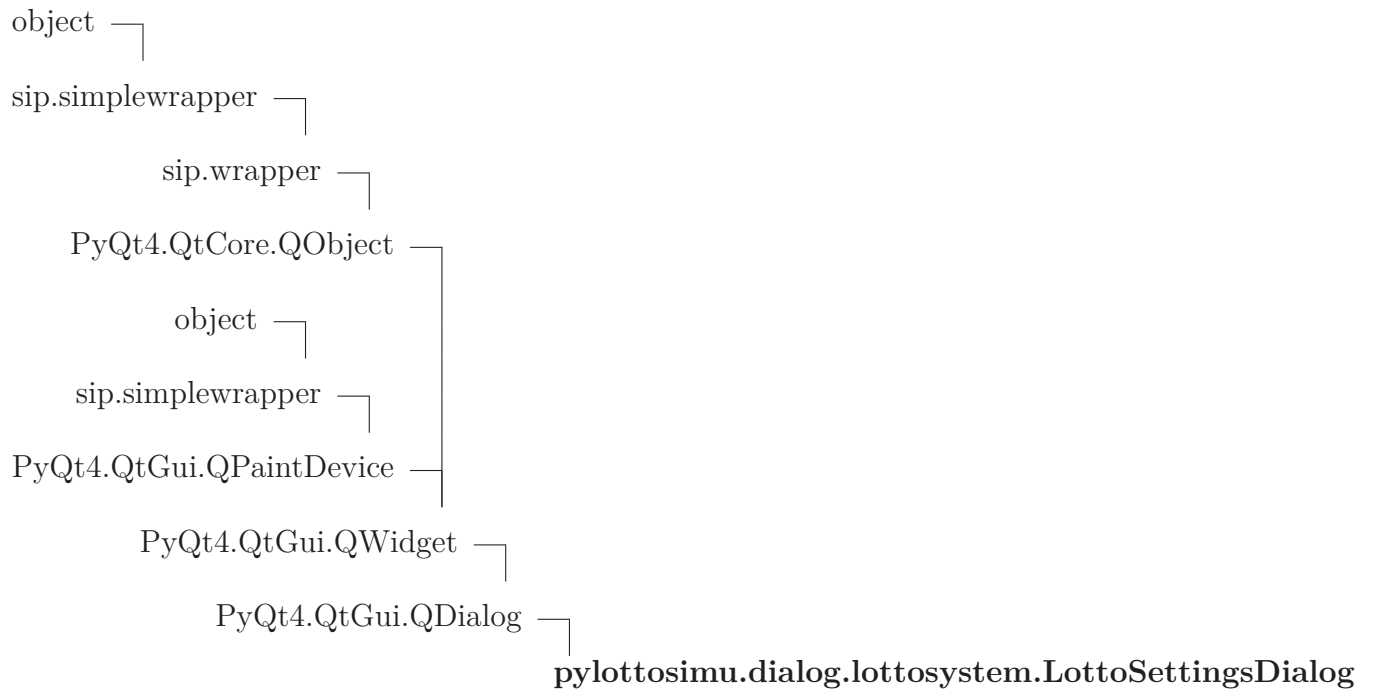

Inherited from object

__package__	Value: 'pylottosimu'

7 Module pylottosimu.lottokugeln_rc3_qt5

7.1 Functions

<code>qInitResources()</code>

<code>qCleanupResources()</code>

7.2 Variables

Name	Description
qt_resource_data	Value: ...
qt_resource_name	Value: ...
qt_resource_struct	Value: ...

8 Module pylottosimu.pylotto

The signals for the GUI

8.1 Functions

gui (<i>arguments</i>)
Open the GUI
Parameters
arguments : language, see in folder translate (<i>type=string</i>)
Return Value
none

8.2 Variables

Name	Description
<code>__doc__</code>	Value: "The signals for the GUI"
<code>__package__</code>	Value: 'pylottosimu'

8.3 Class str

`str(object) -> string`

Return a nice string representation of the object. If the argument is a string, the return value is the same object.

8.3.1 Methods

__add__ (<i>x, y</i>)
<code>x+y</code>

<code>__contains__(x, y)</code>
<code>y in x</code>

<code>__eq__(x, y)</code>
<code>x==y</code>

<code>__format__(S, format_spec)</code>
Return a formatted version of S as described by format_spec.
Return Value
string
Overrides: object.__format__

<code>__ge__(x, y)</code>
<code>x>=y</code>

<code>__getattr__(...)</code>
<code>x.__getattr__('name') <==> x.name</code>
Overrides: object.__getattr__

<code>__getitem__(x, y)</code>
<code>x[y]</code>

<code>__getnewargs__(...)</code>

<code>__getslice__(x, i, j)</code>
<code>x[i:j]</code>
Use of negative indices is not supported.

<code>__gt__(x, y)</code>
<code>x>y</code>

<code>__hash__(x)</code>
<code>hash(x)</code>
Overrides: object.__hash__

<code>__le__(x, y)</code>
<code>x<=y</code>

<code>__len__(x)</code>
<code>len(x)</code>

<code>__lt__(x, y)</code>
<code>x<y</code>

<code>__mod__(x, y)</code>
<code>x%y</code>

<code>__mul__(x, n)</code>
<code>x*n</code>

<code>__ne__(x, y)</code>
<code>x!=y</code>

<code>__new__(T, S, ...)</code>
Return Value a new object with type S, a subtype of T
Overrides: object.__new__

<code>__repr__(x)</code>
<code>repr(x)</code>
Overrides: object.__repr__

<code>__rmod__(x, y)</code>
<code>y%x</code>

<code>__rmul__(x, n)</code>
<code>n*x</code>

__sizeof__(*S*)

size of object in memory, in bytes

Return Valuesize of *S* in memory, in bytes

Overrides: object.__sizeof__

__str__(*x*)

str(*x*)

Overrides: object.__str__

capitalize(*S*)Return a copy of the string *S* with only its first character capitalized.**Return Value**

string

center(*S*, *width*, *fillchar*=...)Return *S* centered in a string of length *width*. Padding is done using the specified fill character (default is a space)**Return Value**

string

count(*S*, *sub*, *start*=..., *end*=...)Return the number of non-overlapping occurrences of substring *sub* in string *S*[*start*:*end*]. Optional arguments *start* and *end* are interpreted as in slice notation.**Return Value**

int

decode(*S*, *encoding*=..., *errors*=...)

Decodes *S* using the codec registered for encoding. *encoding* defaults to the default encoding. *errors* may be given to set a different error handling scheme. Default is 'strict' meaning that encoding errors raise a `UnicodeDecodeError`. Other possible values are 'ignore' and 'replace' as well as any other name registered with `codecs.register_error` that is able to handle `UnicodeDecodeErrors`.

Return Value

object

encode(*S*, *encoding*=..., *errors*=...)

Encodes *S* using the codec registered for encoding. *encoding* defaults to the default encoding. *errors* may be given to set a different error handling scheme. Default is 'strict' meaning that encoding errors raise a UnicodeEncodeError. Other possible values are 'ignore', 'replace' and 'xmlcharrefreplace' as well as any other name registered with codecs.register_error that is able to handle UnicodeEncodeErrors.

Return Value

object

endswith(*S*, *suffix*, *start*=..., *end*=...)

Return True if *S* ends with the specified suffix, False otherwise. With optional *start*, test *S* beginning at that position. With optional *end*, stop comparing *S* at that position. *suffix* can also be a tuple of strings to try.

Return Value

bool

expandtabs(*S*, *tabsize*=...)

Return a copy of *S* where all tab characters are expanded using spaces. If *tabsize* is not given, a tab size of 8 characters is assumed.

Return Value

string

find(*S*, *sub*, *start*=..., *end*=...)

Return the lowest index in *S* where substring *sub* is found, such that *sub* is contained within *S*[*start*:*end*]. Optional arguments *start* and *end* are interpreted as in slice notation.

Return -1 on failure.

Return Value

int

format(*S*, **args*, ***kwargs*)

Return a formatted version of *S*, using substitutions from *args* and *kwargs*. The substitutions are identified by braces ('{' and '}').

Return Value

string

index(*S*, *sub*, *start*=... , *end*=...)

Like *S*.find() but raise ValueError when the substring is not found.

Return Value

int

isalnum(*S*)

Return True if all characters in *S* are alphanumeric and there is at least one character in *S*, False otherwise.

Return Value

bool

isalpha(*S*)

Return True if all characters in *S* are alphabetic and there is at least one character in *S*, False otherwise.

Return Value

bool

isdigit(*S*)

Return True if all characters in *S* are digits and there is at least one character in *S*, False otherwise.

Return Value

bool

islower(*S*)

Return True if all cased characters in *S* are lowercase and there is at least one cased character in *S*, False otherwise.

Return Value

bool

isspace(*S*)

Return True if all characters in *S* are whitespace and there is at least one character in *S*, False otherwise.

Return Value

bool

istitle(*S*)

Return True if *S* is a titlecased string and there is at least one character in *S*, i.e. uppercase characters may only follow uncased characters and lowercase characters only cased ones. Return False otherwise.

Return Value

bool

isupper(*S*)

Return True if all cased characters in *S* are uppercase and there is at least one cased character in *S*, False otherwise.

Return Value

bool

join(*S*, *iterable*)

Return a string which is the concatenation of the strings in the iterable. The separator between elements is *S*.

Return Value

string

ljust(*S*, *width*, *fillchar*=...)

Return *S* left-justified in a string of length *width*. Padding is done using the specified fill character (default is a space).

Return Value

string

lower(*S*)

Return a copy of the string *S* converted to lowercase.

Return Value

string

lstrip(*S*, *chars*=...)

Return a copy of the string *S* with leading whitespace removed. If *chars* is given and not None, remove characters in *chars* instead. If *chars* is unicode, *S* will be converted to unicode before stripping

Return Value

string or unicode

partition(*S*, *sep*)

Search for the separator *sep* in *S*, and return the part before it, the separator itself, and the part after it. If the separator is not found, return *S* and two empty strings.

Return Value

(head, sep, tail)

replace(*S*, *old*, *new*, *count*=...)

Return a copy of string *S* with all occurrences of substring *old* replaced by *new*. If the optional argument *count* is given, only the first *count* occurrences are replaced.

Return Value

string

rfind(*S*, *sub*, *start*=... , *end*=...)

Return the highest index in *S* where substring *sub* is found, such that *sub* is contained within *S*[*start*:*end*]. Optional arguments *start* and *end* are interpreted as in slice notation.

Return -1 on failure.

Return Value

int

rindex(*S*, *sub*, *start*=... , *end*=...)

Like *S*.*rfind*() but raise *ValueError* when the substring is not found.

Return Value

int

rjust(*S*, *width*, *fillchar*=...)

Return *S* right-justified in a string of length *width*. Padding is done using the specified fill character (default is a space)

Return Value

string

rpartition(*S*, *sep*)

Search for the separator *sep* in *S*, starting at the end of *S*, and return the part before it, the separator itself, and the part after it. If the separator is not found, return two empty strings and *S*.

Return Value

(head, sep, tail)

rsplit(*S*, *sep*=... , *maxsplit*=...)

Return a list of the words in the string *S*, using *sep* as the delimiter string, starting at the end of the string and working to the front. If *maxsplit* is given, at most *maxsplit* splits are done. If *sep* is not specified or is *None*, any whitespace string is a separator.

Return Value

list of strings

rstrip(*S*, *chars*=...)

Return a copy of the string *S* with trailing whitespace removed. If *chars* is given and not *None*, remove characters in *chars* instead. If *chars* is unicode, *S* will be converted to unicode before stripping

Return Value

string or unicode

split(*S*, *sep*=... , *maxsplit*=...)

Return a list of the words in the string *S*, using *sep* as the delimiter string. If *maxsplit* is given, at most *maxsplit* splits are done. If *sep* is not specified or is *None*, any whitespace string is a separator and empty strings are removed from the result.

Return Value

list of strings

splitlines(*S*, *keepends*=**False**)

Return a list of the lines in *S*, breaking at line boundaries. Line breaks are not included in the resulting list unless *keepends* is given and true.

Return Value

list of strings

startswith(*S*, *prefix*, *start*=..., *end*=...)

Return True if *S* starts with the specified prefix, False otherwise. With optional *start*, test *S* beginning at that position. With optional *end*, stop comparing *S* at that position. *prefix* can also be a tuple of strings to try.

Return Value

bool

strip(*S*, *chars*=...)

Return a copy of the string *S* with leading and trailing whitespace removed. If *chars* is given and not None, remove characters in *chars* instead. If *chars* is unicode, *S* will be converted to unicode before stripping

Return Value

string or unicode

swapcase(*S*)

Return a copy of the string *S* with uppercase characters converted to lowercase and vice versa.

Return Value

string

title(*S*)

Return a titlecased version of *S*, i.e. words start with uppercase characters, all remaining cased characters have lowercase.

Return Value

string

translate(*S*, *table*, *deletechars*=...)

Return a copy of the string *S*, where all characters occurring in the optional argument *deletechars* are removed, and the remaining characters have been mapped through the given translation table, which must be a string of length 256 or None. If the *table* argument is None, no translation is applied and the operation simply removes the characters in *deletechars*.

Return Value

string

upper(*S*)

Return a copy of the string *S* converted to uppercase.

Return Value

string

zfill(*S*, *width*)

Pad a numeric string *S* with zeros on the left, to fill a field of the specified width. The string *S* is never truncated.

Return Value

string

Inherited from object

`__subclasshook__()`

8.3.2 Properties

Name	Description
<i>Inherited from object</i> <code>__class__</code>	

8.4 Class **LottoSimuDialog**

The GUI and programm of the pyLottoSimu.

8.4.1 Methods

<code>__init__(self)</code>
Initial user interface and slots
Return Value
none
Overrides: <code>object.__init__</code>

<code>init(self)</code>
Initial variable
Return Value
none

ontimer(*self*)

Start time to show a number.

Return Value

none

show__next__number(*self*)

Simulation of the draw and show the next Number on the Screen.

Return Value

none

onbtn__draw__overview(*self*)

show dialog of the draw

Return Value

none

onsystem(*self*)

show dialog of the draw

Return Value

none

onbtn__start(*self*)

Start simulation with the first drawing init timer with the value from the Scrollbar the next drawing starts with the timer event.

Return Value

none

action__lottosim(*self*)

Changing the layout for simulation or generation Move the textedit and change the visible.

Return Value

none

onrandom__numbers__generator(*self*)

Show the output from the random number generator.

Return Value

none

onclean_output_text(<i>self</i>)

Clean the output text

Return Value

none

oninfo(<i>self</i>)

info message box

Return Value

none

onwebsite(<i>self</i>)

Open website

Return Value

none

onclose(<i>self</i>)

Close the GUI

Return Value

none
